8 of 8 hits resolved within 5 minutes.

> **Measurement Definitions:** A target is considered resolved when price touches the target level during the same trading session. Retraction is the maximum distance price moved away from the target after the alert before reversing back to reach it, measured against the 1-minute chart. The p25 / median / p75 band describes the typical retraction zone among resolved targets: 25% of hits retraced less than the p25 value, half less than the median, and 75% less than the p75 value. Target generation logic is proprietary and outside the scope of this document.

MARKET STATE CONTEXT

DIMENSION	CLASSIFICATION
Session Direction	Down 176.25 pts (-0.57%)
Session Range	233.75 pts — Above Average
Trend Quality	Rotational / Choppy (efficiency 18%)
Realized Volatility	25.5 pts avg candle range

All context metrics are computed directly from session price and volume data. Trend Quality reflects how much of the session's movement was net directional progress versus rotation. Provides environmental context for interpreting resolution behavior without implying execution logic.

MISSED TARGET SUMMARY

METRIC	VALUE
Targets Not Reached	1
Closest Miss	2.75 points
Avg Distance on Misses	2.75 points
Directional Breakdown	0 Bullish, 1 Bearish
Avg Target Distance at Generation	7.75 pts on misses vs 4.59 pts on hits

Misses are documented when present. Target Distance at Generation compares how far misses sat from price when alerted versus hits — larger asks carry lower resolution odds. Absence of misses does not imply forward reliability.
